

# Saving time by making care simpler and smarter

## Challenges in care

Inpatient and outpatient elderly care is characterized by numerous administrative tasks. Manual documentation takes up a lot of time and ties up resources that could be used directly for client care. Labor shortages affect the quality of care during home visits or at the facility. Time pressure and cumbersome regulatory requirements often lead to incomplete or delayed documentation, which can impair the quality of care.

## The solution: The myneva.care app

myneva.care is an innovative app solution for inpatient and outpatient elderly care. It makes the documentation process more efficient through voice recordings and AI support, allowing care staff to spend more time on the direct care of their clients. The app integrates seamlessly with existing myneva products and adapts to the specific needs of your organization.

## Key benefits

### Efficient documentation through voice input

With the Speech to Care function, myneva.care enables quick and easy documentation directly at the point of care. Care staff can record their work in real time via voice commands, without feeling the documentation effort. This saves valuable time and reduces stress in everyday working life.

### Seamless and precise recordings

With the help of AI (myneva.ai), important information is extracted from voice recordings, automatically structured and synchronized with the myneva desktop solution. This minimizes errors or gaps in the recordings and ensures that all important information is captured in full.

### Greater transparency and easy communication

All health data, reports, tasks, and documents are bundled in one app and available at any time. Thanks to a translation function from 99 languages with dialect recognition, language barriers are overcome and collaboration in international teams is made much easier.

# Key features

## Care Reports

Optimized documentation saves valuable time and reduces administrative effort.

## Speech to Care

The app automatically translates from 99 languages and enables care staff to efficiently document all necessary information directly at the point of care.

## Wound documentation

Wounds can be photographed and documented to effectively track the healing process and treatment success.

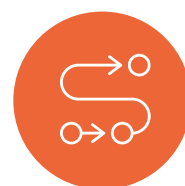

## Health measurements

New health readings and protocols can be added and updated directly by voice. The app provides insights into the client's health condition, graphs illustrate how the client's health measurements develop over time.

## Confirmation of care interventions

Caregivers can easily and quickly confirm which care interventions have been completed by voice.

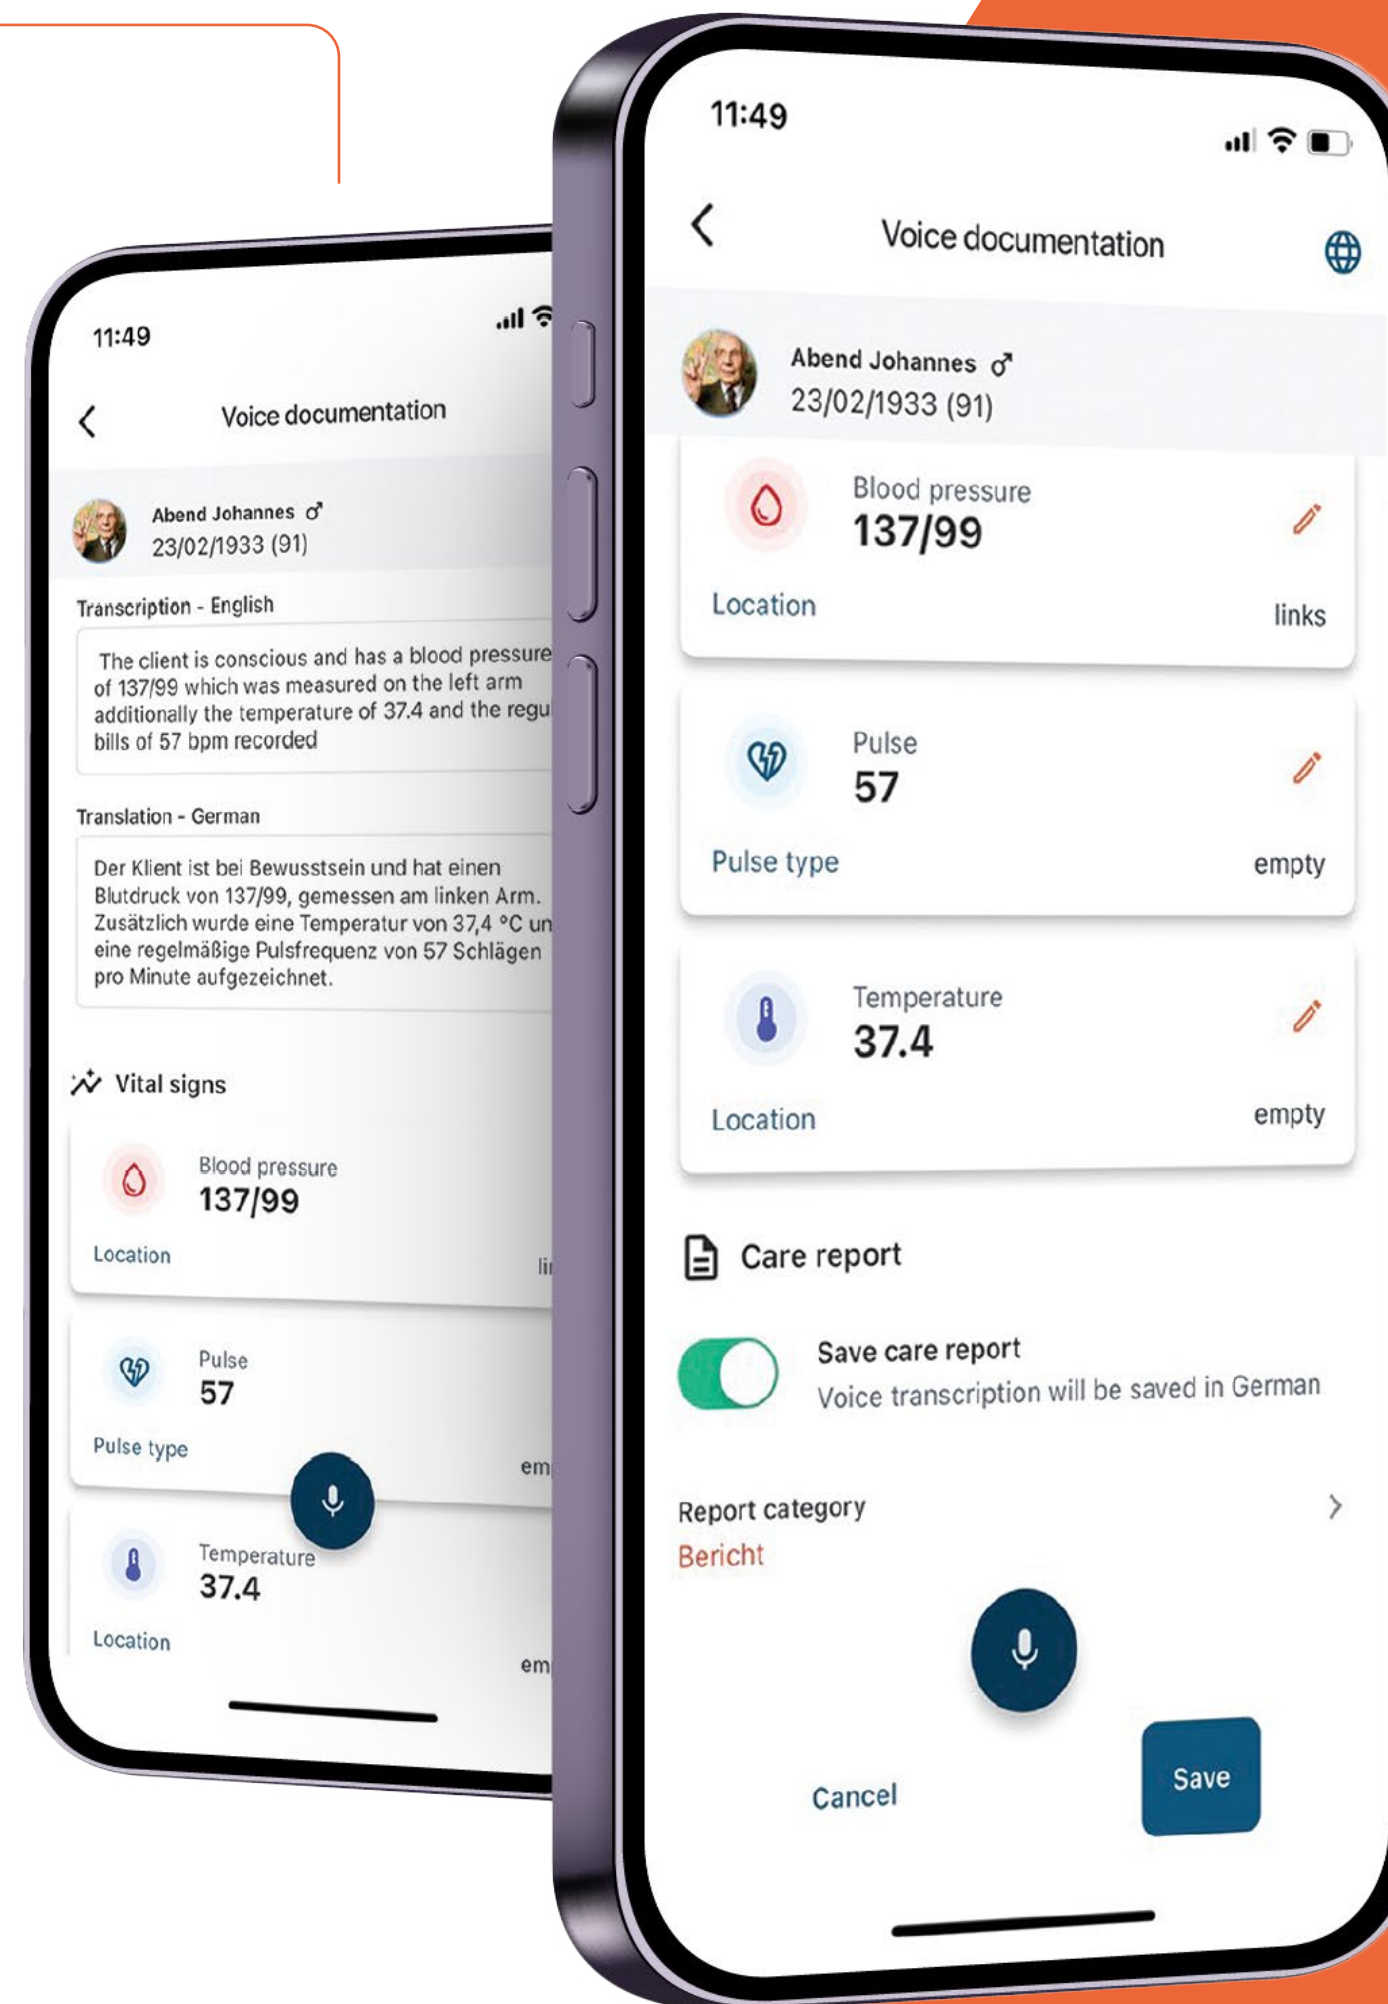

## Structured daily and tour planning

Clear overview of tasks and appointments – with simple time tracking and the option to take on appointments and activities from the team.

## Medication overview

Overview of which medications a client receives – including name, dosage, and start date.

## How does myneva.care help your organization?

### 1. More time for care

Less time spent on documentation frees up time so that your care staff can focus on what really matters: the direct care of your client.

### 2. Better quality of care

Precise and complete documentation allows you to improve the quality of care and increase client satisfaction.

### 3. Simple implementation

Integrates into your existing processes and immediately makes the day-to-day work of your care staff easier.

### 4. Data security – Made in Europe

myneva.care meets the highest security standards. All data is processed in a secure, data protection-compliant environment in Germany.
